geotechnical engineering is now a fundamental component of construction projects the
first volume of this book therefore paves the way for the development of a lasting
partnership between soil and foundations applied geotechnics for construction projects
1 first defines identifies and classifies soils exploring their complexities and
weaknesses and then outlines the basic principles of stresses and strains that establish
and develop within soils the third chapter of the book introduces and develops methods
of soil investigation in order to experimentally determine the geotechnical parameters
that are useful in the design stage of construction projects each chapter of this first
volume is illustrated with photographs of example construction sites and concludes with
concrete examples of real projects the result is a combination of geotechnical expertise

and lessons learned from experience both of which are highly valuable in the field of applied geotechnics for construction projects

geotechnical engineering is now a fundamental component of construction projects the second volume of this book addresses the fundamental principles of soil mechanics and the role of water in geotechnical projects and assessments applied geotechnics for construction projects 2 outlines the hydraulic properties of soils and the basic concepts of water in soil detailing the principles of permeability measurement tests and giving concrete test cases and then goes on to outline the basic notions of soil mechanics as applied in geotechnics from consolidation to short and long term notions via the swelling phenomena of clayey soils soil shear strength and slope stability the third chapter presents a comprehensive overview of geotechnical expertise using examples of concrete projects either with or without damage in the context of geotechnical construction works each chapter of this second volume provides concrete examples of applications to real projects and the rules and lessons we must remember the result is a combination of geotechnical expertise and lessons learned from experience both of which are highly valuable in the field of applied geotechnics for construction projects

geotechnical engineering is now a fundamental component of construction projects the fourth and final volume of this book presents a range of retaining structures alongside soil reinforcement and improvement techniques and processes applied geotechnics for construction projects 4 first presents the concept of thrust fall then goes on to examine the behavior of retaining structures and their design and justification methods a variety of practical applications for retaining structures are then considered covering gravity walls sheet pile curtains in advance shoring excavations and retaining diaphragm walls the book goes on to study soil reinforcement and improvement techniques a subject that the author has dedicated thirty five years to researching and teaching from reinforced earth in situ soil nailing micropiles in situ soil compaction stone columns and rigid inclusions to soil cement and lime cement columns this book ends with a comprehensive and practical discussion of the behavior of underground structures covering the concepts of convergence confinement stress evolution and subsidence estimation each chapter of this fourth volume is illustrated with concrete examples and measurements of retaining structures soil reinforcement and soil improvement from construction sites the result is a combination of geotechnical expertise and lessons

learned from experience both of which are highly valuable in the field of applied geotechnics for construction projects

the development of reinforced and prestressed concrete during the last 50 years was highly promoted by the comit   euro international du b  ton ceb and the f  d  ration internationale de la pr  contrainte fib in 1998 these two associations merged forming the f  d  ration internationale du b  ton fib the results of ceb and fib had been distributed in different ways such as ceb bulletins d information fib reports fib notes and ceb news these bulletins or reports comprised various kinds of information such as state of the art reports research reports application manuals guides to good practice and the ceb fib model codes 1978 and 1990 these model codes provided design principles and application rules to the structural engineering profession and have been predominantly used for code drafting by many national and international standardizing bodies the textbook on structural concrete is now intended to provide background information and justification especially for the ceb fib model code 90 and in some fields of recently extended knowledge it is addressed to advanced students this means that basic information on structural analysis and behaviour of structural concrete is a required prerequisite practising structural engineers may utilize it for gaining background information on the ceb fib model code 90 and national or regional codes as for ex eurocode 2 based on mc 90 the textbook is also conceived to assist teachers at technical universities or engineering schools to achieve better understanding of the recent theories on structural concrete having these targets in mind the general assembly of ceb decided already in 1995 to set up a special activity group dissemination of knowledge to realise that work the authors invited to draft the different chapters had been mostly involved already in drafting the model code 90 in this way consistent information could be provided both for the code and the textbook each chapter has been thoroughly discussed and commented within the special activity group 2 this textbook was first presented to fib members during the technical activity workshop in october 1999 in prague held in connection with the first fib symposium the authors are looking forward to receiving comments from various corners

geotechnical engineering is now a fundamental component of construction projects the third volume of this book is its backbone dedicated to foundations for civil and industrial construction projects applied geotechnics for construction projects 3 first presents the

basic theoretical principles and rules governing the designing and validation of foundations shallow semi deep and deep then presents real foundation projects with a detailed comparison of the approaches and methods of calculating foundations in relation to the reference systems and rules in force closely compared to and validated by the eurocodes the third chapter presents examples of foundation projects covering high side building rafts strip footings piles and embankments enriched by an unprecedented level of experience in the field of foundations for civil and industrial construction projects it ends with examples of damage to foundations and practical appendices each chapter of this third volume is illustrated with photographs and measurements of construction sites and is built on both theory and experience in the field of foundations as a whole the result is a combination of geotechnical expertise and lessons learned from experience both of which are highly valuable in the field of applied geotechnics for construction projects

icssd 2002 is the second in the series of international conferences on structural stability and dynamics which provides a forum for the exchange of ideas and experiences in structural stability and dynamics among academics engineers scientists and applied mathematicians held in the modern and vibrant city of singapore icssd 2002 provides a peep at the areas which experts on structural stability and dynamics will be occupied with in the near future from the technical sessions it is evident that well known structural stability and dynamic theories and the computational tools have evolved to an even more advanced stage many delegates from diverse lands have contributed to the icssd 2002 proceedings along with the participation of colleagues from the first asian workshop on meshfree methods and the international workshop on recent advances in experiments and computations on modeling of heterogeneous systems forming a valuable source for future reference the proceedings contain 153 papers including 3 keynote papers and 23 invited papers contributed by authors from all over the world who are working in advanced multi disciplinary areas of research in engineering all these papers are peer reviewed with excellent quality and cover the topics of structural stability structural dynamics computational methods wave propagation nonlinear analysis failure analysis inverse problems non destructive evaluation smart materials and structures vibration control and seismic responses the major features of the book are summarized as follows a total of 153 papers are included with many of them presenting fresh ideas and new areas of research all papers have been peer reviewed

and are grouped into sections for easy reference wide coverage of research areas is provided and yet there is good linkage with the central topic of structural stability and dynamics the methods discussed include those that are theoretical analytical computational artificial evolutionary and experimental the applications range from civil to mechanical to geo mechanical engineering and even to bioengineering

the second edition of the structural concrete textbook is an extensive revision that reflects advances in knowledge and technology over the past decade it was prepared in the intermediate period from the cep fib model code 1990 mc90 to fib model code 2010 mc2010 and as such incorporates a significant amount of information that has been already finalized for mc2010 while keeping some material from mc90 that was not yet modified considerably the objective of the textbook is to give detailed information on a wide range of concrete engineering from selection of appropriate structural system and also materials through design and execution and finally behaviour in use the revised fib structural concrete textbook covers the following main topics phases of design process conceptual design short and long term properties of conventional concrete including creep shrinkage fatigue and temperature influences special types of concretes such as self compacting concrete architectural concrete fibre reinforced concrete high and ultra high performance concrete properties of reinforcing and prestressing materials bond tension stiffening moment curvature confining effect dowel action aggregate interlock structural analysis with or without time dependent effects definition of limit states control of cracking and deformations design for moment shear or torsion buckling fatigue anchorages splices detailing design for durability including service life design aspects deterioration mechanisms modelling of deterioration mechanisms environmental influences influences of design and execution on durability fire design including changes in material and structural properties spalling degree of deterioration member design linear members and slabs with reinforcement layout deep beams management assessment maintenance repair including conservation strategies risk management types of interventions as well as aspects of execution quality assurance formwork and curing the updated textbook provides the basics of material and structural behaviour and the fundamental knowledge needed for the design assessment or retrofitting of concrete structures it will be essential reading material for graduate students in the field of structural concrete and also assist designers and consultants in understanding the background to the rules they apply in their practice

furthermore it should prove particularly valuable to users of the new editions of eurocode 2 for concrete buildings bridges and container structures which are based only partly on mc90 and partly on more recent knowledge which was not included in the 1999 edition of the textbook
